WHY PS MAGAZINE?

Dear Half-Mast,

I'm a confirmed reader of PS and have gotten loads of valuable information out of it. But I've run into a most confusing problem.

There have been times when I've taken some good dope out of PS and used it. Somebody comes along and says that the magazine is not an authoritative source and I shouldn't be using it.

As far as me and my buddies go, PS is just the thing we need. It keeps us up-to-date and tells us what we should do with some of the quirks in our equipment. But then we're told we can't use it.

What's the deal, Sarge? This is getting me mighty confused.

SFC J.D.L.

Dear SFC J.D.L.,

The best way to go about answering your question is to ask you to look on the first inside page of any recent issue of PS. Right above the list of contents, you'll notice this statement—

PS MAGAZINE

PUBLISHED BY THE DEPARTMENT OF THE ARMY FOR THE INFORMATION OF ORGANIZATIONAL MAINTENANCE AND SUPPLY PERSONNEL.

Now, that means just what it says—it's for your information to use as your post or major unit commander sees fit. If there's something in PS that goes against what is usually done at your installation, then your boss (the CO) has the last word.

But, usually, there should be little or no difference between what PS says and what's actually done. Every word that's printed in PS is reviewed by our people to make sure it's in agreement or doesn't conflict with TM's, TB's, SB's, MWO's and the rest. And, in addition, the same people that approve the directives also approve articles for PS Magazine.

Sometimes you'll find that PS gives you information that just isn't in some other publication. That, too, is logical, since one publication (TM, for example) can't possibly cover every situation that may arise. In this case, PS supplements what's already been published. A TM sets minimum standards for maintenance of equipment. If you can do a better job, then more power to you.

One of PS Magazine's jobs is to get new dope out to you as soon as possible.

The biggest job PS has is to let you know that your equipment is only as good as you and your buddies want it to be. And you can keep it the best in the world by the right kind of operation and preventive maintenance.

That's the story. You take it from there.

Half-Mast

PS MAGAZINE

Issue No. 40

1956 Series

Published by the Department of the Army for the information of organizational maintenance and supply personnel. Distribution is made through normal publication channels. Within limitations of availability, older issues may be obtained direct from Preventive Maintenance Agency, Raritan Arsenal, Metuchen, New Jersey.

For explanation of abbreviations used see SR 329-56-1.

NOT A KICK IN A CARLOAD

Your tools aren't going to kick back at you if you learn what they're used for and how to use them.

Of all the equipment you use, your common hand tools are the most useful and yet the most abused.

All the tools that are in your TOOL SET, Organizational Maintenance (2nd Echelon, Set No. 2 Common) are packed into this batch of pictures.

Mull over the pictures and get to know each by name, and what it's used for—sorta make friends with 'em—because they can be—friends, that is.

KNOW YOUR TOOLS

NO NEED TO GIVE YOUR SUPPLY A HARD TIME IF THE TOOLS YOU GET AREN'T EXACTLY LIKE THE ONES LISTED. IT'S JUST THAT DIFFERENT MANUFACTURERS HAVE MADE THE ITEM, BUT THEY'LL BOTH DO THE JOB!

YOU WANT TO KNOW IF YOU RATE THIS TOOL SET? JUST TAKE A GANDER AT YOUR UNIT'S TOOL SET. IT'LL BE THERE IF YOU'RE SURPRISED TO HAVE IT!

TOOL SET, Organizational Maintenance (2nd Echelon) Set No. 2, Common.

FSN

Hey, there--

You with the M-model vehicles!

If you've got a 1/4- or 3/4-ton 4x4 truck or a 2-1/2- or 5-ton 6x6 truck, then make sure you're cleaning the crankcase-ventilator-valve (alias Donaldson or metering valve) used on the engines of these trucks. They need a cleaning every six months or 6000 miles, whichever comes first, under normal operating conditions.

How do you do it? First, remove the crankcase-ventilator-valve-assembly from the engine. Clamp the valve-body snug in a vise and unscrew the valve-retaining-nut. (Watch how you take this apart so you can put it back together like it was).

Wash the valve, seat, and all orifices with dry-cleaning solvent or volatile mineral spirits to remove any carbon or gum. Check and clean all connecting tubes or lines.

Put the valve and spring in the valve-body and put the retaining-nut back on. Then put the assembly back on the crankcase.

A plea

P-u-h-l-e-e-z-e read your vehicle's caution plates. Got good information there, if you interpret it right.

For example, a plate in the M38A1 Jeep says the vehicle can be driven in second gear and high range up to 40-

MPH. O'course, this doesn't mean running your engine continually in second gear—engine wear'll multiply faster than rabbits, because your engine'll be running at a higher speed than in high gear.

But it's good to know this li'l fact when you hit that hilly country and your engine begins laboring in high gear. By shoving her into second, you can hit up to 40-MPH without your engine overloading itself. It also increases the life of your engine by keeping the operating temperature at a normal 180 degrees and eliminates a lot of spark plug troubles.

Anchors away

It's usually the simple things that cause the biggest pains. Take that parking brake in your M133 series 2-1/2-ton trucks, for example.

Most guys know that they're not supposed to move their truck unless that parking brake's released and that they're not supposed to use that brake to stop, except in emergencies. But a lot of guys are forgetting the simple—and are getting nothing but pains.

When that parking brake is used wrong, one terrific strain is put on the parking anchor, which is part of the transfer, and it can snap. When this happens, your handbrake goes kaput.

So, take a tip—make sure that handbrake's released whenever you move your truck, and use it wisely like it tells you in the TM 9-819A. O'course, if that anchor's breaking for no good reason, get a UER off immediately—if not sooner.

WRONG USE OF PARKING BRAKE CAN CAUSE PARKING ANCHOR TO SNAP.

Plug it up

Take a peek at the underside of the flywheel housing cover on your M133 series 2-1/2-ton trucks. There should be a drain plug tapped in.

The word is that you're to leave that plug in the cover at all times. You'll remove it only after fording and every time your truck gets a C service. This'll let all that water and oil that's trapped up in there drizzle out.

If you haven't got a plug tapped in, shuffle your truck back to Ordnance and get them to do the job. MWO Ord G749-W23 gives them the word.

Removing hot sparks

When you begin fussing with those batteries in your tank, there's one thing you've got to remember—**both** hull ground cables have to be handled first or you may set your tank on its turret.

Every time you remove the battery covers on your light tanks, your M46A1 medium tank and your M47 medium tank, or when you unscrew the battery hold-down clamps on your M48 medium tank, you've got to disconnect and tape the ground cable first. When messing with the battery covers on the T43,

take the ground cables off at the battery.

Each pair of batteries in your tank is connected in parallel. So, disconnecting the ground strap of one pair isn't going to do much good. You'll still have 24-volts streaming thru the system because the other set's grounded.

All you've got to do to be safe is unscrew the cables where they're grounded to the hull and tape the ends. Then remove the covers or hold-down bracket by lifting them straight up—after you unscrew the hold-down clamps.

This dope will be in future manuals.

The ground cables are the last things you hook up when putting batteries back into your tank.

Sparks and gasoline in your hull can become closer than Romeo and Juliet. Follow the ground cable removal method and save yourself a hot seat.

Are your wheel-bearing adjusting-nuts being chewed up for no reason you can figure out? If so, maybe you're using the wrong tool on them.

To save those nuts from dangling on a stripped thread, there's only one tool to use. That's the wheel-bearing nut-wrench listed in the organizational tool

section of all your SNL's.

Here's a chart showing the Ordnance stock numbers of those wrenches for your M-series vehicles. If you've got them, fine—use them. If not, better get them from supply. It's a wise man who uses his tool right.

WHEEL - BEARING NUT - WRENCHES (Ordnance Stock Numbers:)

<p>1/4-Ton Jeep</p>  <p>41-W-3825-200</p>	<p>3/4-Ton Truck</p>  <p>41-W-1991-17</p>

HOW TO START THE HYDRA-MATIC

NOW WE GET INTO THE MEAT OF THIS DEAL... ACTUALLY THE ONLY WAY YOU'LL GET TO KNOW HOW TO HANDLE A HYDRA-MATIC IS TO DRIVE ONE... AFTER YOU'VE GOT THE THEORY DOWN PAT!

SO BEFORE YOU GET UNDER WAY, LET'S GET ON TO THE WAY THIS GADGET WORKS... YOU'LL NOTE I'M DIVIDED INTO HALF BY A HORSESHOE-LIKE SLOT. EACH SIDE HAS A PURPOSE.

I GOT CONNIE RODD TO DO A PIN-UP FOR YOU. KEEP IT WHERE IT'LL DO THE MOST GOOD.

Joe's

Dope Sheet

Your best friend is your Hydra-Matic.
To avoid wear and transmission static,
Keep this chart in your brain
For all kinds of terrain
So your driving will not be
erratic.

WHAT TO USE AND WHEN

FOR EASY GOING,
TRANSMISSION DOES
ALL THE SHIFTING
FOR YOU

**F-1
HIGH**

FOR ROUGH GOING
WHEN ROLLING SPEED
FALLS BELOW 15 MPH.

**F-1
LOW**

CAUTION
15 MPH IS TOP SPEED FOR
LOW RANGE...GET INTO HIGH
FOR FASTER SPEEDS

FOR HILLS—ESPECIALLY
DOWN; TO ACT AS
"BRAKE"; TO KEEP YOUR
TRANSMISSION FROM
"HUNTING"

**F-2
HIGH**

FOR VERY STEEP HILLS
ON GOOD ROADS AND
RUGGED CROSS-COUNTRY
HILLS . . . USE IT FOR
GOING UP AND DOWN

**F-2
LOW**

HIGH

LOW

REVERSE

TAKE IT EASY, DON'T PULL
LEVER WHILE Y'R MOVING
OR YOU'LL SURELY GET
SOCKED WITH A STATEMENT
OF CHARGES.

WE HAVE THE WORLD'S BEST EQUIPMENT... Take care of it

F-1 HIGH

IS FOR SMOOTH HIGHWAYS OR GOOD SOLID GROUND

F-2 HIGH

HAS TWO JOBS... MOSTLY ONE OF THESE DROPS IN THE ROAD SHIFT TO BRAKING POWER

F-2 HIGH

USE YOUR BRAKE IF YOU NEED HELP!

THIS

AND THIS

BACK ON LEVEL ROAD SHIFT TO F-1 HIGH

...SUPPOSE YOU'VE BEEN GOING ALONG IN F-1 HIGH (4th)

THIS IS CALLED "HUNTING" AND IS REAL ROUGH ON THE TRANSMISSION

F-1 LOW

IS FOR THAT ROUGH, COW-PASTURE KIND OF LAND WHEN YOU CAN'T GO FASTER THAN 15 MPH.

HERE'S HOW TO PREVENT HUNTING... ...SAY YOU'RE GOING HERE IN F-1 HIGH (4th)

NOW SHIFT TO F-2 HIGH

SHIFT TO F-1 HIGH AGAIN

WHEN IN F-2 YOU'LL BE LIMITED TO 1ST AND 2ND ONLY... IT CAN'T SHIFT INTO 3RD OR 4TH ...STAY THERE UNTIL YOU'RE OVER THE TOP!

F-2 LOW

IS FOR THOSE VERY STEEP MOUNTAIN-TYPE HILLS! SMOOTH... or ROUGH

....SUPPOSE, FOR

YOU'RE CRUISING ALONG IN F-1 HIGH (YOUR TRANSMISSION'S IN 4TH)

HMM... WHICH DRIVE POSITION TO USE, WHEN... AND AT WHAT MOMENT??

THAT'S THE POINT OF THIS TALK, IT'S A COMBINATION OF EXPERIENCE, JUDGMENT AND KNOWING YOUR GADGET.

YOU LEAVE YOUR LEVER WHERE SHE IS

AS YOU BEGIN A BIGGER INCLINE THE TRANSMISSION SHIFTS DOWNWARD FROM 4TH-TO-3RD TO 2ND ...

NOW YOU SHIFT INTO F-2 HIGH

NOW ON LEVEL GROUND GO BACK TO F-1 HIGH THEN YOU'RE FACED WITH A LONG HIGH CLIMB... NOW'S THE TIME TO USE YOUR HEAD, YOU KNOW YOU'RE NOT GONNA MAKE IT IN F-1 HIGH AND YOU'RE NOT SURE F-2 HIGH WILL DO IT EITHER

HIT THE BASE OF THE HILL IN F-1 SPEED. IF YOU'RE OVER 15 MPH KEEP GOING...

INSTANCE...

OVER THE HUMP SHE'LL UPSHIFT AGAIN INTO 4TH

SLIGHT HILL... SHE'LL GO DOWN TO 3RD

HERE YOUR TRUCK LOSES SPEED... SHE'LL AUTOMATICALLY DOWN-SHIFT

NOW, A STEEP HILL... SHIFT INTO F-2 HIGH FOR BRAKING... STAY THERE, ALL THE WAY DOWN

LEVEL GROUND AGAIN GO BACK TO F-1 HIGH

IF YOU DON'T THINK SHE'LL GO OVER IN F-2 HIGH (LOSING SPEED) SHIFT RIGHT INTO F-2 LOW. STAY THERE UNTIL YOU'RE OVER

PUT HER INTO F-2 HIGH WHEN SHE BEGINS TO LOSE SPEED

IF THERE'S LEVEL GROUND AHEAD, SHIFT INTO F-1 HIGH. IF ANOTHER HILL'S AHEAD (UP OR DOWN) GO INTO F-2 HIGH

LOW RANGE REVERSE

REVERSE HIGH RANGE

IS FOR BACKING UP
ON ROUGH COW PASTURE
TYPE OF TERRAIN

IS FOR THAT GOOD
LEVEL GROUND
OR SMOOTH ROAD

ANSWER

DEPT.

AN UNPARDONABLE BELCH

Dear Half-Mast,

A few of our tanks really foul up in cold weather. They start belching like a guy after a two-day binge and give off more black smoke than a steel mill.

Here's what happens: At idle the tanks run fine. They start out OK, too. After being on the road a while, they start belching black smoke, and we have a tough time keeping them running. We park—we start—we run—b-u-r-p. Over and over again this happens. And a complete check shows that everything's OK.

What's your diagnosis, Sarge? We need help, so start acting like a medic.

CWO P. J. C.

Dear CWO P. J. C.,

The diagnosis is carburetor hiccups brought on by the carburetor icing up in cold weather. A carburetor can freeze up—it's common if conditions are just right.

Here's how: As the air's sucked into the carburetor it expands a bit as it

leaves the venturi tubes. This lowers the temperature. At the same time, you're spraying liquid gasoline into this stream of air, and as the gasoline evaporates it lowers the temperature even more. So, you very often get temperatures in the carburetor which're below freezing even though the outside temperatures may be above 32 degrees F.

This low temperature usually doesn't cause any trouble. But, if the air's very humid, water vapor can condense in the cold carburetor either as water or ice crystals. In either case, you get ice piling up inside your carburetor, blocking off the jets and changing the shape of the

venturi—in other words, a general plug-up. That's when you get the belching and black soot.

If you have this icy condition there's only one way to cure it—de-icing. Before starting your engine in cold weather, start your personnel heater. Start your auxiliary engine, too. Make sure the cover assembly and seals are tight over your air-cleaner ducts so that you draw warm air from the fighting compartment into the engine compartment. Start your engine when the engine compartment is nice and warm.

Keep that warm air going through your carburetor and you'll have no more trouble. Gives no more burps.

You'll see this poop in future TM's.

Half-Mast

STARTING MADE EASY

Dear Half-Mast,

I got troubles when it comes to starting my M38 1/4-ton Jeep. I push down on the starter-pedal and nothing happens. I've replaced a number of starter-switches and even a few starters themselves. Yet the trouble still happens. What do you suggest?

Sgt V. L. G.

Dear Sgt V. L. G.,

First I suggest you take a look at your starter pedal linkage. If it's OK—not bent or anything—chances are the internal adjustment of your starter-switch is on the fritz. But, no sweat. Here's what to do!

Take the vehicle back to Ordnance. They'll remove the starter-switch from the starter. Then, they'll remove the plunger assembly from the starter-switch, and see if the plunger is lying flush against the plunger-spring.

When the plunger is screwed down against the plunger-spring, the plunger is too short and cannot make the positive contact needed to turn the starter over.

It won't take Ordnance long to set it right—all they'll do is :

Before hopping into your Jeep and driving away, make sure Ordnance checks that Jeep for timing as per TM 9-1825B, par 110c. By the time you get done you should have one good starting Jeep.

Half-Mast

TRIP TICKET TRICK

Dear Half-Mast,

About the new trip ticket DD Form 110—when doing our daily services do we only check the items listed on the ticket, or do other items get checked also?

Lt J. J. S.

Dear Lt J. J. S.,

Although the trip ticket doesn't say so—thought everyone knew that the vehicle's technical manual is used when checking your vehicle. It's right there in the last sentence of paragraph 8a of your TM 9-2810. The trip ticket is something on which to record the service you perform and what you find.

You can add the items the TM has but your DD Form 110 doesn't have, or you can scratch thru those that are not present on the vehicle being checked.

Half-Mast

FASTEN-A-TING

Dear Half-Mast,

We're having trouble getting the fastener that holds the instrument cluster mounting plate stud in the dashboards of the Willys, Reos, Dodges and International Harvesters. These fasteners are not listed in the SNL's. What to do, please?

Sgt M. L. B.

Dear Sgt M. L. B.,

Sorry but those pesky li'l fasteners are not an item of supply.

They were put there as an ease-of-maintenance part. All you've got to do to remove your cluster mounting plate

is to turn the studs one-half turn. The studs disengage from the fasteners and your cluster mounting plate falls out. Then these fasteners come loose, and it's easy to lose 'em.

If you do lose them and can't find a replacement, the parts to use to keep your mounting plate in place are: Cap-screw, hex head, S, Cd or Zn pltd, 3/8 x 16 NC, 3/4 inch length (Ord Stock No. H001-5026721); wing nut, 3/8 x 16 NC-2 (Ord Stock No. H101-0126032); and washer, 3/8 inch plain (Ord Stock No. H001-7045561).

The ease-of-maintenance is gone, but at least you won't have mounting plates flopping 'round all over the place.

Half-Mast

A VELVET TOUCH

Dear Half-Mast,

An Air Force outfit stationed near us has eliminated a lot of clutch troubles on the 5-tonners by using a clutch disc called the "Velvetouch clutch disc." They say the oil and grease usually

found on these clutches do not affect this type disc.

How can we get some of these clutch discs?

Sgt L. T. S.

Dear Sgt L. T. S.,

The "Velvetouch" clutch disk is a commercial type disk which although now being tested has not been approved for Ordnance use. Until such time as tests have been completed, I'd hesitate to use them. If you'll get your truck to Ordnance and have them modify your clutches according to these two "Urgent" MWO's—Ord G744-15 (13 Sept 54) and G744-W16 (8 Nov 1954) as well as abide by TB 9-837-5 (17 May 1954) you shouldn't have any trouble with oil and grease contaminating your 5-ton clutches.

Half-Mast

BULLDOG BOLTS

Dear Half-Mast,

The bolts that hold the final drive housing to the bull of our M41 tanks take quite a beating from stones and stuff picked up and carried by the track. Usually the heads just get battered up, but sometimes—in really rough terrain—the bolts will shear.

We been wondering what can be done about this. Any ideas?

Sgt A. F. W.

Dear Sgt A. F. W.,

Yep. Just hold everything for awhile—and hope the bolts do likewise. (Keeping 'em good and tight will help.)

There's an MWO on the way that handles the problem for all light tanks with the Bulldog chassis. Adds a plate to the housing to protect the bolt heads. Watch for it.

Half-Mast

GO BY THE BOOK

Dear Half-Mast,

There exists a doubt in my mind as to what is the correct cold lubricant level for the front and rear differentials on the 2½-ton truck M135.

TM 9-819A, dated July 1951, paragraph 59, says: "Add lubricant to bring level up to within ½ inch of plug opening when cold or to plug level when hot." But LO 9-819A (21 Oct 52) Note 5, says: "Other gear cases fill to plug level."

Which should we follow?

Capt J. B.

Dear Captain J. B.,

This time you'd better go by the book until you get a copy of LO 9-8024 (14 June 55). It has the right dope in it—the same as you see in TM 9-819A. You're asking for trouble when you add more lube than you need.

Lube expands when it gets hot—too much lube in those differentials will burst oil seals and leave you with a drippy rear end.

Half-Mast

WHEN THE MERCURY'S LOW

HOW'S YOUR HEAT?

Your heater can do a man-size job for you this winter, if you know how to use it and keep it on the ball.

To get hot, you've first got to know what kind of switch-box you're fooling with. They're two types of switch-boxes—those that have a HI-LO switch on them to regulate what they're putting out and those that have a separate thermostat.

NEW
STYLE
CONTROL
BOX

For the heater control with the HI-LO switch, turn the switch to HI. Hold the RUN-OFF-START switch in START position until the pilot light goes on—then, snap this switch to RUN and your heater'll start raising heat within three minutes.

When your heater is giving off more heat than you can take, that HI-LO switch really comes in handy. All you've got to do is flip your heater-control from HI to LO and it'll cool off. Then, when you get a little cold and want some heat,

OLD STYLE
CONTROL BOX

flip the switch to HI and it'll start putting out again.

For the other type of control, you'll find a thermostat either to the left of the driver's seat or between the driver's and assistant driver's seats. This thermostat is marked HIGH, MEDIUM and LOW—what kind of heat do you want?

To start this type of heater;

To regulate the amount of heat:

There's a safety device that automatically shuts off the fuel supply if your heater fails to burn. The electrical system has two circuit-breakers that'll cut off the electricity if you get a short or overload. If you don't feel warm air at the heat outlet within four or five minutes or if your pilot fails to light on those heaters that have a pilot, be sure you—

If it's getting too hot for you, no sweat. Just turn the heater off. If you've got a HI-LO switch, turning the switch to LO **will not** turn the heater off, just the same as turning the thermostat to LOW in your other type heater will not turn the heater off. In both, you've got to turn the heater switch to OFF.

When turned off, burning in the heater will stop within a few seconds, but the blowers will continue to run for two or three minutes until all the unburned gases are blown out. When this happens and your heater is cool, the blowers will shut off automatically.

If you want to see more poop on these heaters, take a squint at TM 9-8662 (12 Mar 54.)

Your personnel heater will keep you warm to temperatures as low as -25 degrees F. When the temperature gets lower than that, an engine heater together with your personnel heater is needed. TM 9-8662 gives you the poop on engine heaters. Paragraphs 26 to 48 tell you how to take care of your personnel heater. The parts bible for your personnel heater is SNL G-249, Vol. I.

This chart tells what winterization equipment is applicable for your M-series trucks. The type equipment you get depends on what iceberg you're squatting on — SB 9-16 will tell you what's used in what temperature.

ARMAMENT

DON'T SMOTHER YOUR ARTILLERY PIECE

Take a deep breath and hold it for a moment, will'ya, 'cause this is all about the respiration on your hydro-pneumatic recoil mechanisms on field artillery.

Those mechanisms do a lot'vc breathing, too, and they gotta exhale that air just like you do. That's why they have a respirator, or similar device, on the recoil or counter-recoil cylinder. Every hydropneumatic's got one. Some of 'em, like in the 105-mm howitzer, are adjustable. Some of 'em aren't. But they all serve the same purpose. They help re-

duce the shock of counter-recoil by letting air out of the cylinder easy-like.

When they get stopped up with dirt, water, paint, grease, or what-have-you, the air doesn't escape in the right amount at the right time and you get a real nervous counter-recoil action.

So the point of this long-winded yarn is this: To keep your weapon from pant in'and gaspin' and bucking in counter-recoil, make sure she's respiratin' all right. It'd be just plain foolishness to smother a good weapon.

155-MM HOWITZER
RESPIRATOR,
NON-ADJUSTABLE

105-MM HOWITZER
RESPIRATOR,
ADJUSTABLE

HAVE YOURSELF A FIT

Some of you 155-mm howitzer men may be having trouble screwing a big nut with a little wrench.

The wheel spindle nut wrench (Ord Stock No. J013-5576543 or 41-W-3252-125) was designed for the small-type wheel spindles. When the new, larger-type spindles were put in, some of the wrenches were changed, but some of 'em weren't. So you may have a wrench with the spindle, or small end, too small to fit the wheel bearing retaining nut.

If you have one, you can make it work by cutting or grinding 1/8-in metal from the inside span.

DECAL DITHER?

Maybe it shouldn't happen, but sometimes the decals on the inside of your tanks get painted over or worn off—like those on the turret walls, recoil guards, and stowage boxes that say "safe", "canteen", "grenades", "off-on", etc.

These decals are important—but they're difficult to repaint or trace. So, what do you do?

Probably the people most concerned have been the rebuild shops; they get

the stuff that's had the worst treatment. These general-type decals are not stocked in supply, so they resort to local procurement. Or, in some cases, stenciling.

But using units might find local procurement a little difficult. Even if your crewmen read Nipponese.

Grapevine has it that a move's afoot to get all necessary decals into regular supply system sometime in the future. But—for now your best bet's to latch onto a Joe who's handy with a paint brush. And if you're lucky, there'll be a new or rebuilt buggy around—with all decals intact—to use for a model.

There's a 1-in stencil outfit in your 2nd echelon common tool set. If you feel the need of something smaller, Quartermaster has a 1/2-in set available. It's QM Stock No. 42-S-23000-000 (FSN 7510-00-19045).

THINNER DOPE

Here's another reminder on the right stock numbers to use when you order paint and thinner for the antenna on the M33 fire control system.

The paint is Enamel, synthetic, semi-gloss, air-drying, olive drab, No. 2430 (1 gal), Eng Stock No. 52-3476.017.100.

As for the thinner, you ask for Thinner, synthetic enamel, Eng Stock No. 52-7895.500.010.

This is different from the thinner stock numbers PS gave you on page 849 of Issue 18 and page 6 of Issue 22. Better make those changes pronto so you'll be getting the thinner you need.

PLEASE — THOSE NIPPLES ARE TENDER

Some folks have been having trouble with those recoil mechanism buffer-assembly nipples breaking on their Skysweeper.

To keep those nipples (Ord Stock Nos. D048-7213477 and H106-0219-621) from going kaput, lay off that extra elbow grease. Those nipples will break when tightened too tight—so easy on them.

Bring them down good and snug—not too tight. When too tight they're put under strain and tension; then when the gun fires, shock does the dirty work.

That also goes for the nipples that go into counterecoil buffer assembly (Ord Stock No. D048-7213472). Also tube lock (Ord Stock No. D048-7213478) to nipple (Ord Stock Nos. D048-7213-477 and/or H106-0219621).

Watch those plugs (Ord Stock No. D048-7213475) too. Not too tight, please.

It's a good idea to replace gaskets (Ord Stock No. H002-0501215) if they look like they're too flat or damaged. It'll save that extra damage-causer twist.

NIKE VAN BATS

Are you Nike guys keeping in mind that the charging rate for your trailer storage batteries is not the same for summer and winter?

When the chill winds blow, y'need more juice to take care of the personnel heater load. But—you've got to use the lower rate in summer, or you overcharge.

Here's how the adjustment stacks up for your director station, launching control, radar tracking and maintenance vans:

Locate the E2 terminal board at the rear of the left wall in the compartment behind your battery charger meter panel.

For winter operation, the **white lead** should be connected to Terminal 19 of the E2 board.

For summer operation, change the white lead to Terminal 18.

Thass all there is to it.

ACQ ANTENNA SLING

As you AAA men know, you sometimes have your acq antenna mounted on a platform to eliminate some of the ground clutter.

So it becomes a bit unhandy to lift the tubs and particularly the radome into place. Now if you can get the battery wrecker-man to help you, life is much simpler, **unless** you tear up the dome while you're hoisting it.

A sure way to prevent this is to make a sling like the one shown here. You need a steel ring, any size that will fit over the hook on the wrecker, four 6-foot lengths of 3/8-in cable, and four snap hooks. You can either clamp the cables, as this man did, or if you happened to be a cable splicer, you could splice 'em in.

And never try to emplace or march order the acquisition **without** the wrecker. The old grunt-and-groan system tears up too many radomes.

PUZZLE NO MORE

TB Ord 605 (19 May 55) ends worrisome guesswork in checking Field Artillery, Antiaircraft Artillery and Combat Vehicle Armament Hydro-pneumatic Recoil Oils for emulsification. The TB supersedes all other dope out on the subject—it's also being revised to cover all the above mentioned weapons. It goes into detail on how to spot oil that's been contaminated by nitrogen or air.

RUST HO

Wouldn't happen in the desert—but it will at some posts where the weather is dampish.

Saw a colonel, no less, get a gig for tiny specks of rust on his weapon. And his wasn't the only speckled one around.

Seems as how these tiny specks of rust form on small arms and are hard as heck to get off. Bore cleaner is about the only thing that'll do it.

You have to bounce your eyeballs over your weapon in sunlight to see this stuff. Artificial light just won't get it.

Then you've got to keep her oiled proper.

FOGGY DIALS

Dear Sgt Dozer,

What's wrong with the hourmeters on our D4 and D8 Caterpillar tractors? The glass fogs up until it's impossible to get a dial reading. We had the meters removed, inspected and new gaskets installed, but no dice—the window still sweats. Do we have a couple of bum meters, or is the trouble somewhere else?

Sgt W. C.

Dear Sgt W. C.,

There'll be no sweat for you and your hourmeters if you'll try a minor fix for the meters' retainer assemblies. You need a small vent plug (Mfr's Part No. 4H7329) and a new retainer assembly (Mfr's Part No. 6B1914). You can take a gander at 'em in Fig A. Have your local purchase channels get these parts from the nearest Caterpillar agency. Your shop can put 'em together for you. The new #6B1914 retainer assembly has the hole for the plug, while the old assembly doesn't.

Be sure to tell your shop that the hole in the small plug must face the ground, or downward, when inserted into the new retainer assembly. To find which side of the retainer assembly faces downward, screw the assembly good and tight on the hourmeter housing and mark the bottom end of the retainer.

Then remove the retainer and put the plug in so its little hole looks down on the mark you made.

If your shop can do the job, here's another angle on the hourmeter fix. Let them modify your old-type retainer assembly like this:

1. Mark the bottom of the retainer assembly before you remove it.
2. Remove and disassemble the retainer assembly and drill a $15/64$ " hole right smack in its middle (See Fig 2).
3. Ream the hole to $.257/.255$ ".
4. Press in the new vent plug with its hole facing the mark you made.
5. Then put in a felt washer under the retainer's metal washer (like it shows in Fig 3) and reinstall the assembly.

Here're the parts you need to rework your old retainer assembly:

- 1—felt washer (Mfr's Part No. 4H6634)
- 1—vent plug (Mfr's Part No. 4H7327)
- 1—washer (Mfr's Part No. 4B4277)

NEW VENT PLUG PRESSED INTO HOLE IN CENTER OF RETAINER ASSEMBLY

Fig 1

Fig 2

DRILL A $15/64$ " HOLE LIKE THIS AND REAM THE HOLE TO $.257/.255$ ".

NEW HOUR METER RETAINER ASSEMBLY HAS FELT WASHER TO FILTER AIR ENTERING HOUR METER THROUGH VENT PLUG.

Fig 3

Sgt Dozer

WARM FOR THIS FORM

Be sure you take a good look at AR 755-548, dated 14 Dec 1954, 'cause that one tells you how to recover unserviceable recoverable spare parts and how to fill out DA Form 5-22. That's the new Unserviceable Part Identification Tag. A unit uses this tag for all recoverable repair parts that become unserviceable. There's no mistaking this tag. It's as green as an Irishman's tie on St. Patty's day.

Remember, though, that this tag's for unserviceable recoverable parts, not for ones that're obviously scrap or salvage. You get rid of those like it tells you in AR's 755-5 and 755-7.

This new 5-22 tag's a real dandy. All you gotta do in the unit is fill out the first five blocks on the front side of the card. That includes the part description, stock number, name, make and model, and serial number of the end item.

After the unit fills out this part of the tag, it's turned in or sent to the unit's supporting field maintenance activity on a Turn-In slip (DA Form 447) or an Army Shipping Document, whichever's applicable.

When the tag gets to your field maintenance support activity, technical inspectors'll give the parts the once-over and decide what'll be done with 'em. The inspector will check one of the blocks on the bottom of the tag. This'll

The illustration shows a green 'UNSERVICEABLE PART IDENTIFICATION TAG' (DA Form 5-22) with a cartoon character peeking over the top. The tag is divided into several sections: 'PART DESCRIPTION', 'PART STOCK NUMBER', 'END ITEM DESIGNATION', 'MAKE AND MODEL', and 'SERIAL NUMBER'. Below these are three checkboxes for 'CHECK APPROPRIATE BLOCK': 'REWORK', 'SALVAGE', and 'FORWARDED TO DEPOT MAINTENANCE'. There are also checkboxes for 'EXCHANGED WITH COMMERCIAL ACTIVITY' and a 'SIGNATURE OF INSPECTOR' line. The bottom left corner of the tag reads 'DA FORM 5-22'. Above the tag is a box labeled 'SEARCH OF DIRECTIONS FOR REPAIR' with a cartoon character looking at it.

The Unit fills in these blocks.

This space is for the Field Maintenance Technical Inspector's decision

The Technical Inspector also fills in the back side of the tag.

call for the part being either reworked, salvaged, forwarded to depot maintenance or exchanged with a commercial activity. If necessary, the inspector'll also fill in the back side of the tag that's used to give the reason or directions for repair.

Whenever possible, the turn-in of an unserviceable item and a replacement issue should occur at the same time. This doesn't mean, though, that the turn-in of a repair part isn't a completely separate transaction, 'cause it is.

There'll be some cases, of course, when like serviceable items can't be turned-in before or at the same time you request a replacement. When this happens, you'll state in the "Authority" block of the 446 that a like serviceable item will be turned-in promptly or give the reason why the like item isn't available for turn-in.

Simple, isn't it? Yep, the DA Form 5-22 is a real slick item when you use it right. Just follow the directions and you can't go wrong.

Pull up a chunk of ice
and listen to the tale of—

BLOWTORCH JOE

Remember the story about "Lucky Pierre" way back in PS Issue 11? Ah yes, Pierre was a lucky one all right. He never took care of his equipment and always seemed to get away with it, but he got his—in the end.

This one's about Pierre's buddy. His name was Blowtorch Joe, a real gone guy who thought the flame from a blowtorch was the solution to some of his winter maintenance problems. Like Pierre, Joe's taking harp lessons now. He finally learned his lesson, but it had to come the hard way.

It all happened one morning a coupla weeks ago. Joe, a crane carrier driver, was all set to start out on a job. It was one of those cold mornings with sub-zero temperatures. Now Joe was a good operator and a pretty fair mechanic, but he just didn't use his head when it counted most.

He knew that starting internal combustion engines in cold weather sometimes

proved troublesome, because the fuel won't vaporize very well, crankcase oil gums up and batteries go flat. But Joe had the answer. He was going to handle this problem the easy way.

He ran into the shop and came out toting a blowtorch, his old standby.

He started playing the blowtorch flame on the crankcase of the crane carrier and...then it happened...BLOOEY!

WHAT HAPPENED?

THIS...

You can probably guess what happened. Needless to say, Joe won't be using a blowtorch any more, not for any purpose. What really happened was this:

When the flame from the torch warmed up the oil, it also drove off the lighter ends of the fuel that drained from the cylinders into the crankcase. The result—the vaporized fuel exploded, and Joe never knew what hit him.

The boys in Joe's outfit will never forget that one. When they're getting ready to start up a vehicle in cold weather, they check for condensation in the fuel lines, use the right grade of oil and keep the batteries charged. They're not having any trouble. Sure, it takes a little longer, but it's a sure and safe method of getting the job done right.

the round-up

SCREWY—BUT IT WORKS!

HEAVIER SOCKET

Dear Editor,

We've been having trouble getting throttle stops (the one on the end of the throttle cable) so here's how we've

made one from a commercial spark plug cap screw.

**Lt W. R. Horne
APO 949, Seattle**

(Ed Note—If throttle stops G503-7371193 or G503-7371194 are scarce items your idea looks like a swell stop-gap.)

Dear Editor,

We are maintaining a number of M48 tanks, and I have a suggestion to make about the special tool sets being issued for work on these vehicles:

The standard 15/16-in 12-point socket, in both 1/2-in drive and even in the 3/4-in drive sets, will break when used to pull a very stubborn track-connector wedge-bolt. Not always, by any means, but too frequently.

We have found that the PROTO tool Company's Number 7830-H-15/16 heavy duty **six** point socket, 3/4-in drive will stand up to the work. We have yet to break our first one. This socket is designed to be used with an impact wrench, but it can be used with the regular 3/4-in drive T-bar very satisfactorily.

Another thing, if the recess around the heads of the track sprocket bolts were enlarged to accept a heavier socket, that too would prevent lots of wrench breakage.

**M/Sgt Clinton
702 Ord Co.**

EASY KEPT OIL AND GAS RECORD

Dear Editor,

This is for those motor officers and motor sergeants who are always having trouble keeping the mileage chart for the (1,000 mile C) or (6,000 mile D) maintenance services.

We have eliminated charts, graphs, and records by using the oil and gas consumption report form for each vehicle to tell us when those maintenance services are due.

From the PM roster you post the due mileage of the next scheduled C or D maintenance to the oil and gas consumption report form, and when the dispatcher posts each daily trip ticket to this form he'll compare the speedometer reading to the reading for the next scheduled C or D maintenance service.

Your TM 9-2810 allows you a 100-mile tolerance for the C (1,000 miles) service and a 300-mile tolerance for the D (6,000 miles) service. So when you transfer the mileage of the next C or D service from the PM roster to this form, you'll find it very wise to have the form read 100 miles less on C and 300 miles less on D. This will cause the dispatcher to notify the motor sergeant that maintenance can now be pulled on the vehicle.

DATE						SIGNATURE					

When the speedometer reading reaches 14,992 the vehicle has reached the 100 mile "C" tolerance zone and the "C" maintenance service can now be performed.

The oil and gas consumption report form will tell you how many miles the vehicle traveled during the month and the amount of oil and gas used. If the gas or oil used by some vehicles is much greater than others for the same mileage, then a check should be made to find the cause. (Might be carburetor, condition of engine, pilferage, etc.).

Mr. Louie Shirrell
Ft Knox, Ky.

(Ed Note—Par. 25, TM 9-2810 (Oct 53) gives the local commander the go-ahead on the use of whatever additional forms he feels are necessary for proper control of his vehicles.)

Connie Rodd's BRIEFS

Generator protector

For you guys who have the Model C-37M ACF-Brill 37-passenger, bus, a lot of mud, dirt and other glob gets around the field coils and armature of the generator. If you'll take that bus back to Ordnance, they'll put a generator shield on for you like it says in MWO Ord G784-W1 (17 Mar 55).

Pressure note

To stop the pressurized cooling system in your M38A1 Jeep and M170 front line ambulance from pulling an Old Faithful, make sure the temperature of your coolant is below 200 degrees before slowly loosening the radiator filler cap. Remove the cap only after the pressure has escaped.

Light tank edition

You can still get that special light tank issue, PS No. 14. Just drop me a card or letter in care of PS Magazine, Raritan Arsenal, Metuchen, N. J. Tell how many copies you need. They'll be mailed right to you.

Jeep harness

If you've got an M38 Jeep that needs a wiring-harness-assembly—as of now you have to make one. Use cable (Ord Stock No. H005-0812364) and the necessary parts from Douglas connector kit (Ord Stock No. H020-5701060). A wiring-harness-assembly is on its way into the supply system. Until it gets there you'll have to make your own.

Jeep curtains

No need to raise a lot of hullabaloo 'cause you can't find the stock numbers of the curtains for your 1/4-ton truck. Just grab a pencil—here they are: Curtain, left, door assy. (Ord Stock No. G740-7697413); Curtain, left, side quarter, assy. (Ord Stock No. G740-7697415); Curtain, right side quarter, assy. (Ord Stock No. G740-7697416); Curtain, right, door assy. (Ord Stock No. G740-7697414).

It's new poop

Did you get hold of Change 1 (30 Mar 55) to TM 9-8022 yet? If not, grab your copy of this new manual on the M44 series trucks and make a note by the tire pressure specs on page 62 that the dual-wheeled jobs take 45-PSI when traveling over highways and cross-country.

SURE...GET IT DIRTY

use it!

**YOUR SNL AUTHORIZES YOU
ANOTHER IF YOU WEAR IT OUT**
